                                                                                                                                                                                                                                                                                                                                                            PT Polymorphic bowlne DNA markers - used in genetic identification,
PT gene mapping, and selective breeding
PS Table 7; Page 379; 517pp; English.

CC The sequence is that of a bowlne microsatellite sequence obtd.
CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
CC One out of 50 clones cross-hybridised. Assuming independent
CC distribution of microsatellites and MboI sites, the frequency of
CC (T6)n >9 microsatellites in the bowlne genome is estimated at >100,
CC is summarised in the specification and indexed herein (see below).
CC The sequences upstream and downstream of the microsatellite sequence
CC were used to generate the required PCR primers for in vitro
CC amplification of the corresp. microsatellite (using the program
CC optiprimy). The microsatellites may be used to identify individuals,
CC for parentage testing, and in the genetic mapping of economic trait
CC loci, or genes involved the determinism of economicatily important
CC see also Q33501-34437.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PT gene mapping, and selective breeding
Table 7; Page 277; 517pp; English.

CC The sequence is that of a bovine microsatellite sequence obtd. by
CC screening a library of bovine MboI DNA fragments of between
CC one out of 50 clones cross-hybridised. Assuming independent
CC distribution of microsatellites and MboI sites, the frequency of
CC (76)n >9 microsatellites in the bovine genome is estimated at >100,
CC occurrence information for ca. 230 such bovine microsatellites
CC occurrence information and indexed herein (see below).
CC is summarised in the specification and indexed herein (see below).
CC were used to generate the required PCR primers for in vitro
CC amplification of the corresp. microsatellites for primers for in vitro
CC maplification of the microsatellites may be used to identify individuals,
CC for parentage testing, and in the genetic mapping of economic trait
CC loci, or genes involved the determinism of economically important

Primer PDJ33 is one of several primers which are preferred for use in amplifying inter-Alu regions of DNA. The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can be used to detect genetic variation.

See Q27389-Q27404 and Q33141-Q33144.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pr decedion of polymorphic genetic markers of the form (dc-dA)n(dg-dT)n - using novel nucleic acid mols. as primers blsclosure; Column 9-10; 186pp; English.

CC The invention relates to the isolation of polymorphic repeat sequences (dc-dA)n.(dg-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, thuman genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dg-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers T65798-T66047. Those clones where the repeat sequence has been determined are shown in T65704-797. This repeat concerns the form the marker clone Mdf36 which contains the repeat sequence is from the marker clone Mdf36 which contains the repeat concerns and the formula: (AC)15AT(AC)5A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding gene mapping, and selective breeding Table 7; Page 352; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below).

The sequences upstream and downstream of the microsatellite sequence
                                                                                                                                                                                                                                                                                                                                                               Microsatellite sequence from clone TGLA438. The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to the isolation of polymorphic repeat sequences con having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic contexts, especially for use in e.g paternity or maternity testing, commercial analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis.

CC commercial animal or plant breeding or pedigree analysis.

CC the repeats, when analysed, fall into 4 categories:

CC liperfect repeats which are alternating tandem CA repeats with no context separated by no more than 3 consecutive non-repeat bases;

CC jimperfect repeats which are defined as 2 or more runs of uninterrupted compound perfect repeats which are uninterrupted runs of CA separated by no more than 3 consecutive non-repeat bases;

CC interruptions and without adjacent repeats from a run of at least compound perfect repeats which are uninterrupted runs of the perfect compound repeats which are uninterrupted of a sequence other than conformat least 10 uninterrupted mononuclectides; and compound repeats except that the runs of CA are interrupted.

CC This sequence with structure: A(CA)ISTACG(CA)6, would be scored as 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding Table 7; Page 353; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below).
                                                                                                                                                                                                                                                                                                                                                                                                          Q34056

                                                                                                                                                     ş
                                                                                                                                                                                                                                                                                                       gene mapping, and selective breeding

Table 7; Page 304; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine microsatellite sequence obtd. by

cone out of 50 clones cross-hybridised. Assuming independent

distribution of microsatellites and MboI sites, the frequency of

(T6)n >9 microsatellites in the bovine genome is estimated at >100,

000. The sequence information for ca. 230 such bovine microsatellites

is summarised in the specification and indexed herein (see below).

The sequences upstream and downstream of the microsatellite sequence

were used to generate the required PCR primers for in vitro

applification of the corresp. microsatellite (using the program

copTIPRIM). The microsatellites may be used to identify individuals,

for parentage testing, and in the genetic mapping of economic trait

loci, or genes involved the determinism of economically important

contraits esp. in cartile. To allow selective breeding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIFRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. genetic mapping; traits; amplification; ss.
Bos taurus.
                                    gene mapping, and selective breeding
Table 7; Page 271; 517pp; English.
Table 7; Page 271; 517pp; English.
The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between
250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
One out of 50 clones cross-hybridised. Assuming independent
distribution of microsatellites and MboI sites, the frequency of
(T6)n >9 microsatellites in the bovine genome is estimated at >100,
000. The sequence information for ca. 30 such bovine microsatellite
is summarised in the specification and indexed herein (see below).
The sequences upstream and downstream of the microsatellite sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                06-AUG-1992.

PT Table 7; Page 271; 517pp; English.

CC The sequence is that of a bovine microsatellite sequence obtd. by
CC Screening a library of bovine MboI DNA fragments of between
CC One out of 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
CC One out of 50 clones cross-hybridised. Assuming independent
CC One out of 50 clones cross-hybridised. Assuming independent
CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,
CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,
CC out of the sequence information for ca. 230 such bovine microsatellites
CC is summarised in the specification and indexed herein (see below).
CC The sequences upstream and downstream of the microsatellite sequence
CC were used to generate the required PCR primers for in vitro
CC amplification of the corresp microsatellite (using the program
CC OPTIPRIM). The microsatellites may be used to identify individuals,
CC for parentage testing, and in the genetic mapping of economic trait
CC loci, or genes involved the determinism of economicatly important
CC see also Q33501-34437.

The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /tissue_type="pectoral muscle (after mastectomy)"
/note="Yector: pcDNAII (Invitrogen); Site_1: BstXI;
Site_2: NotI; The library was constructed by G.
Lanfranchi. This library is not subtracted nor normalized.
The first strand cDNA was primed with a biotinylated oligo-dT-NotI primer
(5'-biotin-AACCCGGCTCGAGCGGCCGCTTTTTTTTTTTTTTTTT-3'). The ds cDNA was sonicated and size-selected in the range 350-550 bp. The 3' specific fragments were selected by streptavidin coated magnetic beads, ligated to non-palindromic BstXI adapters, NotI digested and directionally cloned into BstXI-NotI cut pcDNAII vector."

/note="vector: pcDNAII (Invitrogen); Site_1: BGXXI;
Site_2: NotI; The library was constructed by G.
Lanfranchi. This library is not subtracted nor normalized.
The first strand cDNA was primed with a biotinylated oligo-dT-NotI primer
(5'-biotin-AACCCGGCTCGAGCGGCCGCTTTTTTTTTTTTTTTTT-3'). The ds cDNA was sonicated and size-selected in the range 350-550 bp. The 3' specific fragments were selected by streptavidin coated magnetic beads, ligated to non-palindromic BstXI adapters, NotI digested and directionally cloned into BstXI-NotI cut pcDNAII vector."
